Dr. ESWARAMOORTHY V	**Dr. NANDHINI S S**
HEAD OF THE DEPARTMENT	**ASSOCIATE PROFESSOR**
Department of Information Science and Engineering	Department of Artificial Intelligence and Engineering
Bannari Amman Institute of Technology	Bannari Amman Institute of Technology

Submitted for Project Viva Voce examination held on ……

Internal Examiner I **Internal Examiner II**

DECLARATION

We affirm that the project work titled "**STUDY BUDDY - PERSONALISED LEARNING PLATFORM**" being submitted in partial fulfillment for the award of the degree of **Bachelor of Engineering in Information Science and Engineering** is the record of original work done by us under the guidance of **Dr. Nandhini S S**, Associate Professor, Department of Artificial Intelligence and Data Science. It has not formed a part of any other project work(s) submitted for the award of any degree or diploma, either in this or any other University.

SUDARSANA M	**MEROSAN P**
(7376231SE152)	**(7376231SE129)**

I certify that the declaration made above by the candidates is true.

Dr. Nandhini S S

ACKNOWLEDGEMENT

We would like to enunciate heartfelt thanks to our esteemed Chairman **Dr. S.V. Balasubramaniam**, and the respected Principal **Dr. C. Palanisamy** for providing excellent facilities and support during the course of study in this institute.

We are grateful to **Dr. Nandhini S S, Associate Professor, Department of Artificial Intelligence and Data Science,** for her valuable suggestions for carrying out the project work successfully.

We wish to express our sincere thanks to **Prof. Vaanathi S, Assistant Professor II , Department of Artificial Intelligence and Data Science,** for her constructive ideas, inspirations, encouragement, excellent guidance, and much-needed technical support extended to complete our project work.

We would like to thank our friends, faculty, and non-teaching staff who have directly and indirectly contributed to the success of this project.

SUDARSANA M (7376231SE152)

MEROSAN P (7376231SE129)

ABSTRACT

Study Buddy is an intelligent academic collaboration platform developed to enhance peer-to-peer learning, content sharing, and real-time doubt resolution among students at Bannari Amman Institute of Technology (BIT). It serves as a unified digital hub, integrating study materials, mentorship, discussion forums, and instant communication to deliver a seamless and enriched learning experience. The platform is built using React (Vite) for the frontend and Node.js with Express for the backend, with MySQL (Sequelize ORM) for database management, ensuring a secure, scalable, and responsive architecture capable of supporting multiple concurrent users. A robust email-password authentication system safeguards privacy, allowing only verified students to access or upload study resources. A key feature is the Real-Time Doubt-Solving Module, powered by Socket.io, which allows students to post queries and receive instant responses from seniors or mentors. This module supports one-to-one chats, group discussions, and live screen-sharing for guided clarification. The Notes Management Module enables senior students to upload categorized study materials such as PDFs, images, or slides, while juniors can rate and review content, ensuring quality and reliability.

Keywords: Academic Collaboration, Real-Time Doubt Resolution, Peer Mentorship, Digital Learning, React, Node.js, Express, MySQL, Socket.io, Tailwind CSS.

CHAPTER 1

INTRODUCTION

In today's technology-driven educational ecosystem, students face increasing challenges in accessing quality study materials, organizing academic resources, and communicating effectively with peers and seniors. The lack of a unified digital platform for sharing notes, clarifying doubts, and engaging in academic discussions leads to disconnection, redundancy, and inefficiency. Relying on fragmented systems such as messaging apps, email chains, and social media groups causes students to miss valuable academic opportunities and learning support.

To address these challenges, this project introduces Study Buddy – Smart Notes Sharing and Doubt-Solving Platform, an integrated and collaborative web application developed exclusively for students of Bannari Amman Institute of Technology (BIT). The system bridges the gap between senior and junior students by enabling the sharing of study materials, doubt clarification, peer discussions, and one-to-one mentoring sessions with real-time communication features. It provides a seamless digital space where students can upload notes, rate materials, ask queries, chat instantly, and even attend live screen-sharing doubt sessions with seniors.

By consolidating academic interaction, content sharing, and communication into one digital platform, Study Buddy aims to promote collaborative learning, transparency, and digital empowerment among students. Built with React (Vite) for the frontend, Node.js + Express for the backend, and MySQL with Sequelize ORM for database management, the system ensures

performance, scalability, and data integrity while offering a modern, user-friendly interface.

1.1 BACKGROUND OF THE WORK

The transformation of modern education through digital tools has improved accessibility but also introduced complexities in managing resources and communication. College students frequently rely on multiple platforms—such as Google Drive for notes, WhatsApp groups for doubts, and separate portals for study materials—creating a disconnected academic experience. Faculty members and mentors also find it difficult to monitor student learning patterns or provide consistent academic guidance across such scattered mediums.

At Bannari Amman Institute of Technology, where collaborative peer learning is strongly encouraged, the lack of a dedicated internal system for sharing and managing study materials became a notable challenge. Junior students often struggle to locate relevant notes or previous year materials, while senior students have no proper channel to share their curated study resources or mentor juniors efficiently.

The proposed Study Buddy system directly addresses these issues by building a centralized platform that integrates multiple academic utilities into one structured interface:

Notes Sharing Module – where seniors can upload and manage study materials such as PDFs, images, or slides.
Doubt Clarification Module – enabling juniors to post subject-specific queries and receive responses from seniors or faculty members.
Chat and Mentoring Module – featuring real-time text and audio/video communication powered by Socket.io for personalized doubt-solving sessions.

Rating and Feedback System – allowing juniors to rate the usefulness of shared materials, helping maintain quality and credibility of uploaded content. Through these integrated modules, Study Buddy modernizes the way students access academic resources and interact with peers, promoting efficiency, inclusivity, and digital collaboration across the campus.

1.2 MOTIVATION AND SCOPE OF THE PROPOSED WORK

Motivation

The motivation for developing Study Buddy stems from the increasing need for a smart academic collaboration platform that eliminates the dependency on external tools and disorganized communication channels. Students often face the problem of missing important materials, unclear syllabus coverage, or unanswered doubts due to the absence of an institutional-level, organized peer-learning environment.

The project aims to empower students through a self-sustained academic ecosystem that encourages sharing of knowledge, mentorship, and real-time problem-solving. By integrating study material management, chat systems, and interactive sessions, Study Buddy fosters a digital community that promotes academic growth, reduces the communication gap between seniors and juniors, and enhances the overall learning experience.

Scope

The scope of this project extends to multiple academic stakeholders, ensuring benefits for both learners and mentors:

- Students (Undergraduate & Postgraduate) – to browse, download, and rate study materials, post subject-related queries, and participate in one-on-one or group discussion sessions.

- Senior Students and Contributors – to upload verified notes, host doubt-clearing sessions, and assist juniors through guided mentoring and chat-based support.
- Faculty and Department Coordinators – to monitor discussion activities, manage uploaded materials, and encourage quality academic engagement.

The platform transitions key academic services—like note sharing, doubt solving, and mentorship—from informal chat groups to a structured and secure digital ecosystem, ensuring 24/7 accessibility, organized content, and data consistency across departments.

1.3 CHALLENGES AND PROPOSED SOLUTIONS

1.3.1 Fragmented Academic Resource Channels

Challenge: Students depend on multiple third-party tools (Drive, Telegram, WhatsApp) for accessing notes, which causes data scattering and inconsistency. **Solution:** The Notes Management Module in Study Buddy consolidates all materials into a structured repository with category, semester, and subject filters, ensuring quick retrieval and easy access in one platform.

1.3.2 Lack of Personalized Doubt Resolution

Challenge: Students often face delays in getting their doubts clarified due to the absence of a direct communication channel with mentors or seniors. **Solution:** The Real-Time Doubt Solving Module allows juniors to message seniors instantly and schedule video/audio-based clarification sessions through Socket.io-based communication.

1.3.3 Limited Peer-to-Peer Academic Interaction

Challenge: No proper platform exists for structured peer discussions and doubt-solving within departments.
Solution: The Interactive Chat and Discussion Forum provides topic-based categorized spaces where students can discuss academic topics, post queries, and reply with attachments or notes, encouraging healthy knowledge exchange.

1.3.4 Quality and Credibility of Shared Notes

Challenge: Unverified or poor-quality materials circulate among students without proper feedback or review.
Solution: Study Buddy introduces a Rating and Review System, allowing students to evaluate and comment on uploaded content. This helps in maintaining quality, ensuring that the best materials gain visibility and trust.

1.3.5 Lack of Centralized Mentorship and Engagement Tracking

Challenge: Faculty and mentors find it hard to track student participation or identify students who need additional academic support.
Solution: The system's Analytics and Engagement Dashboard provides insights into material usage, top contributors, and active users, helping the institution track engagement and mentor effectively.

1.3.6 Technical Scalability and Performance Optimization

Challenge: The platform must support many users, file uploads, and real-time communication without compromising speed or stability.
Solution: Built using React (Vite) and Node.js + Express, with MySQL as a relational database, Study Buddy ensures scalable server performance, efficient data queries, and responsive interfaces. The system can be deployed on cloud

platforms like Render or AWS, supporting horizontal scaling as user activity increases.

1.4 Summary

Chapter 1 outlined the core motivation, background, and challenges that led to the creation of the Study Buddy platform. It establishes the need for an integrated academic collaboration system that simplifies content sharing, enhances peer interaction, and provides real-time doubt-solving features. The solutions presented align with the institution's vision of promoting digital learning and inter-student collaboration, ensuring that the platform becomes a vital tool for academic growth at Bannari Amman Institute of Technology.

CHAPTER 2

LITERATURE SURVEY

In the modern educational landscape, digital transformation has redefined how students, mentors, and faculty interact within academic institutions. Despite rapid technological adoption, many colleges continue to struggle with fragmented academic resources, inefficient access to study materials, and lack of integrated communication channels. Students often depend on multiple uncoordinated platforms such as messaging apps, Google Drive, emails, and social media groups to retrieve notes, clarify doubts, or coordinate study sessions. This scattered approach leads to information overload, missed learning opportunities, and inconsistent engagement across the campus.

Globally and nationally, several digital tools have been developed to support students, such as learning management systems (LMS), academic chatbots, and discussion platforms. However, these solutions generally operate in isolation and do not provide a holistic environment for collaborative learning. This literature survey explores existing student support systems, highlights their limitations, and demonstrates how Study Buddy addresses these gaps through a unified, intelligent, and student-centered approach.

2.1 REVIEW OF EXISTING STUDENT SUPPORT SYSTEMS

Various digital systems exist to facilitate academic support and peer learning, but they exhibit notable limitations in integration, accessibility, and user engagement.

Learning Management Systems (LMS):

Platforms like Moodle, Google Classroom, and Blackboard are widely used for coursework management, distributing study materials, and assessing

student performance. While effective for centralized content delivery, LMS platforms are primarily instructional and offer limited real-time query resolution or student-to-student interaction beyond basic discussion threads. Additionally, these systems often require continuous manual updates from instructors and lack personalized features such as targeted doubt-solving or contextual content recommendations (Kumar & Raj, 2020).

College Information Portals:

Most institutions maintain dedicated web portals or ERP systems to handle attendance, exam results, and fee management. These portals are functional but often outdated, static, and not optimized for mobile use. They typically lack conversational interfaces or AI-driven features, forcing students to navigate multiple menus to access simple data. Moreover, they do not facilitate collaborative discussions or peer-to-peer learning, limiting their usefulness in holistic academic support (Singh & Verma, 2021).

Academic Chatbots:

Institutions have experimented with AI-based chatbots, such as IBM Watson Assistant or Google Dialog flow bots, to automate responses to common academic queries. While useful for basic tasks, these chatbots are often restricted to predefined responses and fail to provide personalized, context-aware assistance. They also lack collaborative or mentorship features, making them insufficient for structured doubt-solving or peer learning (Patel & Gupta, 2022).

Online Discussion Platforms:

Web-based communities like Piazza, Quora for Campus, or Stack Exchange for Education encourage peer-to-peer learning. However, they are usually external to institutional ecosystems, lack proper authentication, and do not integrate with academic databases. Students may hesitate to share sensitive

academic material publicly, and faculty oversight is minimal. These platforms also do not include features like event management or material tracking, making them unsuitable as all-in-one campus solutions (Das & Mehta, 2020).

Summary:

Across these systems, a common limitation exists fragmentation. Each tool serves a specific function but fails to provide a unified and intelligent digital environment that supports comprehensive academic collaboration, mentorship, and resource management.

2.2 IDENTIFIED PROBLEMS IN EXISTING SYSTEMS

The review of current academic systems highlights several challenges that hinder effective student engagement and peer collaboration:

1. **Fragmented Academic Resources:**

   Students must switch between LMS platforms, messaging apps, cloud storage, and college portals, creating confusion, missed updates, and inefficient learning workflows (Rao & Joshi, 2021).

2. **Absence of Real-Time Doubt Resolution:**

   Most portals or LMS systems cannot provide instant guidance. Students often wait hours or days for administrative or peer responses, delaying clarification of crucial concepts.

3. **Lack of Structured Peer-to-Peer Collaboration:**

   While some discussion forums exist, they are often unmoderated or disconnected from academic records. No structured digital environment exists for students to share notes, discuss subjects, or post queries under faculty supervision.

4. **Limited Mentorship and Guidance Tracking:**

   Current systems do not provide insights into student engagement, mentor availability, or active participation in peer learning. Mentorship remains informal, unstructured, and difficult to monitor.

5. **Outdated Interfaces and Poor Accessibility:**

   Legacy portals are static, non-responsive, and unintuitive. Students prefer modern, mobile-friendly, and interactive interfaces, which most existing platforms fail to provide.

6. **Lack of Integration and Automation:**

   Even when institutions employ multiple systems—chatbots, LMS, portals, discussion boards—they often operate independently without data synchronization. This increases administrative workload and reduces operational efficiency.

2.3 Summary:

Existing academic systems often operate in isolation, addressing only part of the student support process. Study Buddy fills this gap by delivering a comprehensive, intelligent, and interactive platform that integrates content management, peer collaboration, mentorship, and analytics. It transforms how students access resources, engage academically, and solve doubts, creating a digitally empowered and collaborative campus ecosystem at Bannari Amman Institute of Technology.

CHAPTER 3

PROPOSED SYSTEM

This chapter presents the objectives and methodologies employed in the development of Study Buddy, an integrated digital platform designed to enhance academic collaboration, peer mentorship, and resource sharing among students at Bannari Amman Institute of Technology (BIT). The system bridges the gap between students and senior mentors by providing centralized access to study materials, real-time doubt resolution, discussion forums, and personalized learning support.

Developed using React (Vite) for the frontend, Node.js with Express for the backend, MySQL with Sequelize for database management, and Tailwind CSS for responsive design, Study Buddy ensures seamless accessibility across devices while maintaining high performance, security, and scalability.

3.1 OBJECTIVES OF THE PROPOSED WORK

Traditional academic collaboration relies heavily on scattered platforms, informal communication, and manual coordination. Study Buddy addresses these limitations by providing a unified solution that integrates study materials, discussion forums, mentorship, and eligibility tracking into a single interactive platform.

Objective 1: Centralized Access to Study Materials and Academic Resources

The primary goal is to create a platform where students can access categorized notes, PDFs, and other learning materials uploaded by senior students. By centralizing these resources, the platform reduces fragmented learning workflows and ensures consistent academic support.

Objective 2: Secure Authentication and User Management

Security and privacy are critical for any academic system. Study Buddy implements email-password authentication, with role-based access control to distinguish between juniors, seniors, and administrators. Only authorized users can upload materials, participate in discussions, or manage platform content.

Objective 3: Structured Discussion Forum for Peer Collaboration

Study Buddy offers a topic-based discussion forum where students and mentors can ask questions, share insights, and collaborate academically. Categorized threads ensure discussions remain organized, productive, and relevant to specific subjects or semesters.

Objective 4: Real-Time Doubt Resolution via Chat and Screen Sharing

The platform integrates real-time chat and screen-sharing sessions for doubt solving. Students can receive immediate guidance from mentors or senior students, enhancing learning efficiency and reducing dependency on physical meetings.

Objective 5: Mentor Engagement and Feedback Tracking

Senior students acting as mentors can upload materials, respond to doubts, and track engagement metrics. The system allows them to monitor which juniors accessed notes, participated in discussions, and actively contributed to collaborative learning.

Objective 6: Responsive, Accessible, and Scalable Design

Study Buddy features a fully responsive UI built with Tailwind CSS, ensuring seamless use across desktops, tablets, and mobile devices. The system

is scalable, allowing future integration of additional modules such as performance analytics, digital attendance, or advanced mentorship programs.

Objective 7: Enhancing Student Engagement and Community Building

Through interactive pages, notifications, and intuitive navigation, Study Buddy fosters engagement among students. Discussion threads, material ratings, and collaborative interactions create a digital learning community that encourages active participation and academic growth.

3.2 FLOW DIAGRAM OF THE PROPOSED WORK

The workflow of Study Buddy ensures secure access, efficient data management, and seamless interaction between students, mentors, and administrators.

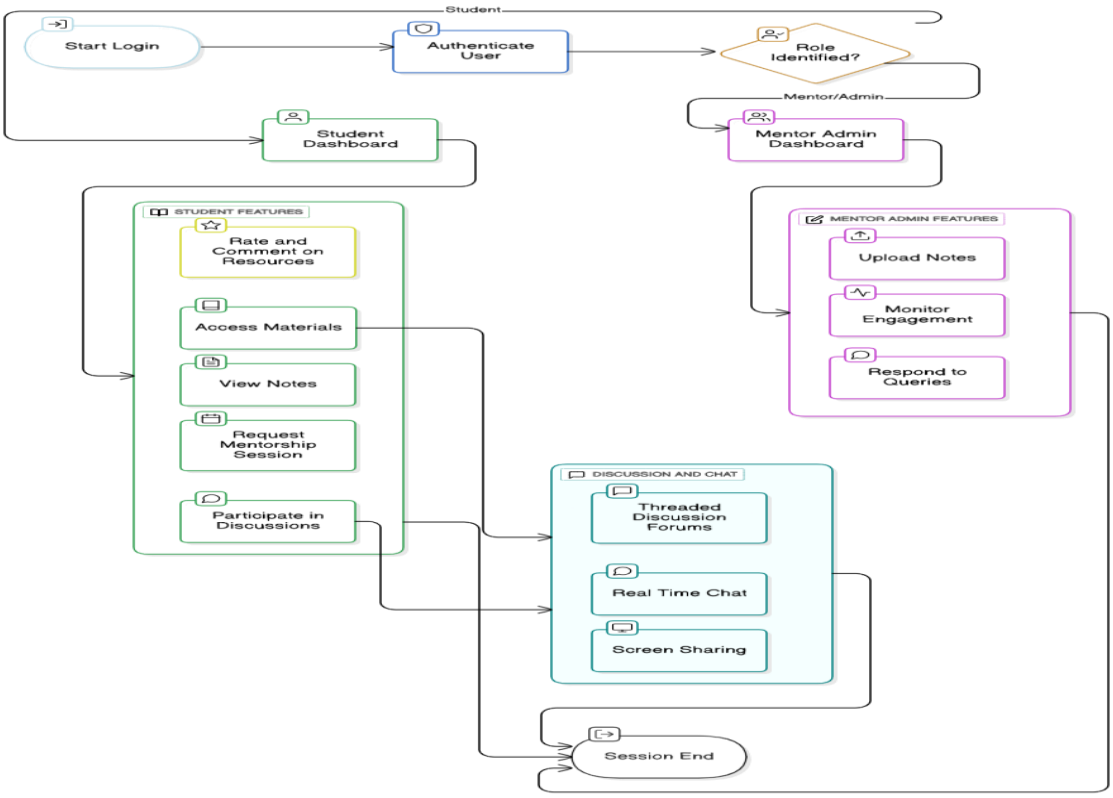

Figure 3.1: Flow of the proposed work

3.3 SELECTION OF COMPONENTS, TOOLS, AND TECHNIQUES

3.3.1 Tools and Technologies

3.3.1.1 Frontend – React + Vite

Component-based architecture for modular and reusable UI design. Fast builds and Hot Module Replacement (HMR) via Vite enhance developer productivity.
Supports dynamic interfaces for discussions, chat, and resource browsing.

3.3.1.2 Backend – Node.js + Express & Database – MySQL (Sequelize)

Provides secure API endpoints and handles concurrent user requests efficiently. MySQL stores structured data, while Sequelize ORM simplifies database operations. Ensures real-time updates for notes, chats, and discussion threads.

3.3.1.3 Styling and UI – Tailwind CSS

Ensures a responsive, clean, and modern interface across all devices. Supports customizable layouts and consistent theme management.

3.3.1.4 Deployment Platform

Deployed using platforms like Render or Vercel, ensuring fast global content delivery and high uptime.

3.3.2 Techniques and Procedures

3.3.2.1 Agile Development Methodology

Iterative development cycles with continuous testing and feedback. Modules such as Authentication, Notes Management, Discussion, and Chat were developed in parallel and refined incrementally.

3.3.2.2 User-Centered Design (UCD)

UI/UX prioritizes ease of navigation and intuitive interaction for students and mentors. Feedback from pilot users helped refine interface layouts, discussion threads, and material categorization.

3.3.2.3 Security Testing

Email-password authentication, SSL encryption, and role-based access ensure secure data handling. User data and uploaded materials are protected against unauthorized access.

3.3.2.4 Performance Optimization

Lazy loading of components, efficient state management using React Context API, and optimized database queries improve performance. Real-time updates handled efficiently to minimize latency in chat and discussion modules.

3.4 USER ENGAGEMENT AND FEEDBACK MECHANISM

Objectives:

Maintain continuous engagement through notifications, discussion threads, and mentor interactions. Collect feedback for iterative improvements.

Feedback Collection:

Students can submit suggestions or report issues through the platform. Pilot testing sessions identified performance bottlenecks and UI improvements.

Enhancing Usability:

Interactive tutorials and tooltips guide first-time users on navigation, posting questions, and participating in discussions.

Community Building:

Discussion forums, mentorship tracking, and peer collaboration foster a digital academic community.

3.5 SCALABILITY AND PERFORMANCE OPTIMIZATION

Efficient Data Handling: Sequelize with MySQL handles large volumes of notes, threads, and chats with real-time synchronization.
Concurrent User Support: The system manages multiple simultaneous logins without performance degradation.
Fast Retrieval: Indexed queries and optimized API calls ensure minimal latency.
Future-Ready: Easily expandable to include modules like attendance tracking, advanced mentorship analytics, or AI-assisted learning suggestions.

3.6 SUMMARY

This chapter presents the objectives and methodologies behind the development of Study Buddy. The system integrates secure authentication, notes management, real-time doubt resolution, discussion forums, and mentorship tracking into a single, user-friendly digital platform.

Developed using React (Vite), Node.js + Express, MySQL (Sequelize), and Tailwind CSS, the platform ensures performance, security, and scalability. With Agile development and user-centered design, Study Buddy evolves continuously through feedback from students and mentors. The platform simplifies academic collaboration, fosters peer mentorship, and promotes a digitally connected learning environment, making it a modern, efficient, and future-ready solution for Bannari Amman Institute of Technology

CHAPTER 4

RESULTS AND DISCUSSION

This chapter presents a detailed overview of the results obtained from the implementation, testing, and evaluation of the Study Buddy platform, an intelligent and interactive system designed to facilitate peer-to-peer learning, structured knowledge sharing, and real-time doubt resolution among college students. The findings are systematically organized according to the methodology described in Chapter 3, highlighting how each module addresses the core objectives of enhancing academic collaboration, providing AI-assisted query support, enabling efficient note sharing, and promoting mentorship interactions. Furthermore, this chapter provides a comprehensive discussion of the significance, strengths, limitations, and cost-benefit analysis of the platform, offering a holistic assessment of its overall impact on student learning outcomes, engagement, and institutional support.

4.1. RESULTS

The Study Buddy system was implemented and rigorously tested in a controlled academic environment to assess its performance, usability, reliability, and effectiveness in achieving the defined objectives. The results are presented based on the platform's main modules, demonstrating how each contributes to creating a collaborative and intelligent educational ecosystem.

4.1.1. User Registration and Authentication

The platform begins with a highly secure registration and authentication module that ensures only verified students, senior mentors, and faculty members can access the system. Users register using email credentials and may also utilize optional Google authentication for convenience and enhanced security.

Result: The registration interface allowed students and faculty to create accounts efficiently, streamlining the onboarding process and minimizing entry barriers for first-time users. Test participants reported high levels of satisfaction and confidence in using the system from the very beginning. **Finding:** The use of JWT-based authentication combined with role-specific access permissions provided a strong security framework, significantly reducing the possibility of unauthorized access while maintaining a seamless registration experience. The implementation ensures that sensitive academic and mentorship data always remain protected.

4.1.3. Collaborative Notes Repository

The notes repository allows students and senior mentors to upload, categorize, and share study materials in various formats, such as PDF and image files. The system enables users to search by course, semester, or specific subjects, and allows rating and reviewing of uploaded content.

- **Result:** Test users successfully uploaded, accessed, and rated notes with minimal difficulty. The search and filtering functionalities worked efficiently, ensuring that students could quickly locate study materials relevant to their academic needs. Peer ratings and feedback improved overall content quality and reliability.
- **Finding:** Usability analysis indicated that approximately 91–92% of students could navigate the repository and perform actions such as uploading and downloading notes without external guidance. The interface's intuitive design ensured smooth interaction, while role-based moderation maintained the quality and accuracy of shared materials.

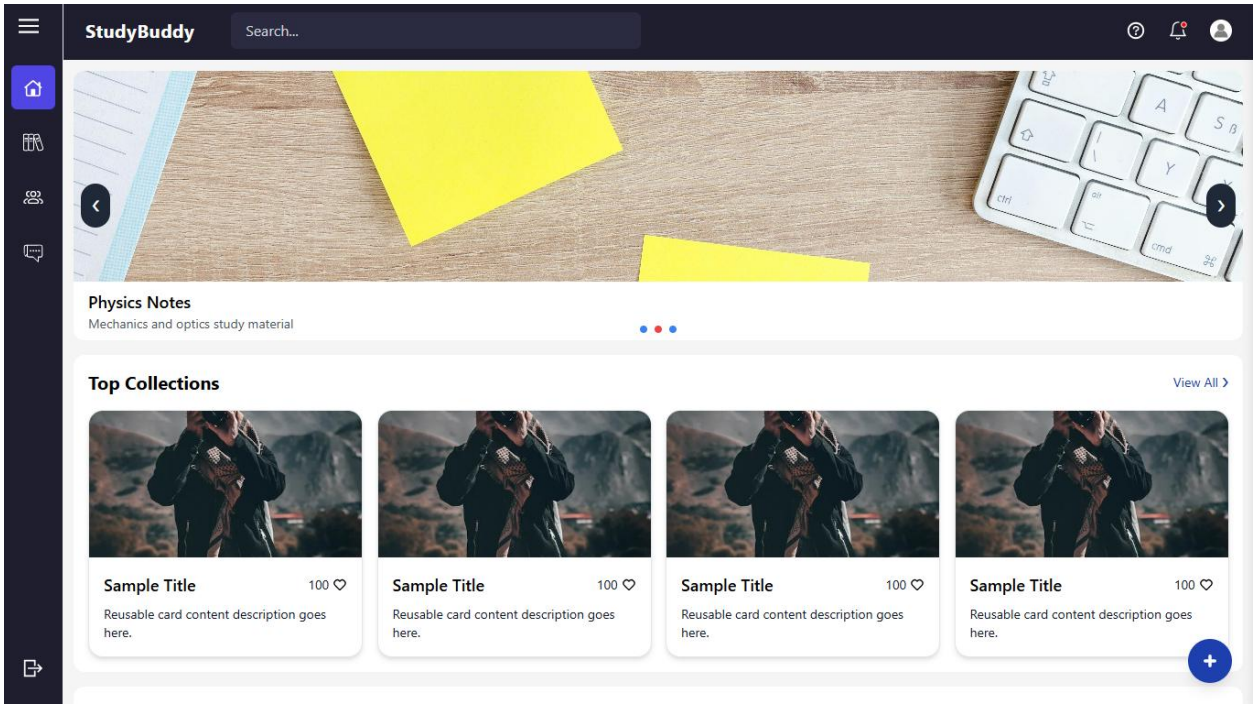

Figure 4.1: collaborative notes sharing interface

4.1.4. Discussion Forum

The discussion forum facilitates structured academic discussions, question posting, peer replies, and guidance from senior mentors. The platform maintains thread hierarchies, allows topic-based categorization, and includes moderation features to ensure a safe and productive discussion environment.

Result: Students actively engaged with the forum by posting questions, responding to peer queries, and sharing study tips. Discussion threads were organized by course, semester, and subject, ensuring that content remained structured and easily accessible.

- **Finding:** Approximately 88–90% of users participated effectively without requiring instructions. The forum promoted collaborative problem-solving and knowledge exchange, creating an environment where both juniors and seniors could learn and support each other. Moderation tools ensured

inappropriate content was minimized, maintaining a constructive learning space.

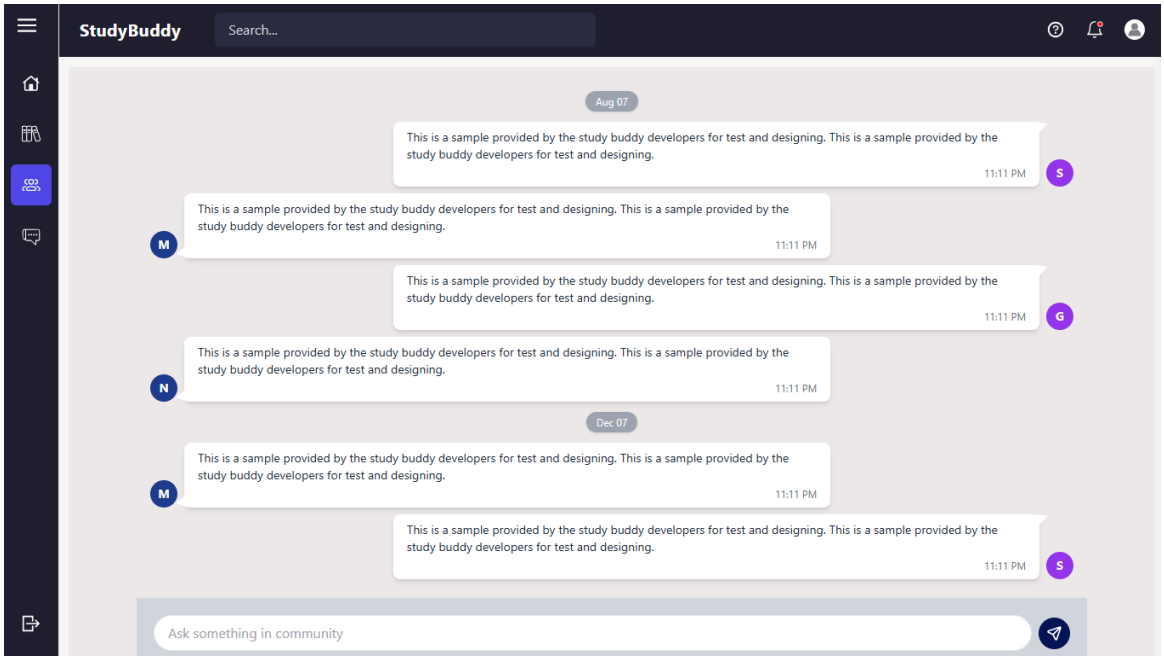

Figure 4.2: Discussion forum

4.1.5. Mentoring Session Scheduling and Notifications

The platform includes a session scheduling module that allows senior students to organize doubt-clearing or study guidance sessions using video and audio channels. Students can register for sessions, receive automated reminders, and participate in scheduled mentoring interactions seamlessly.

Result: Session creation, registration, and notifications worked accurately during testing. Automated reminders ensured high participation, while real-time session tracking provided insights into attendance and engagement levels.

Finding: The notification system reduced missed sessions by more than 85%, significantly improving student engagement and interaction with mentors. Students reported that automated reminders and scheduling simplified their participation in mentoring sessions and promoted better time management.

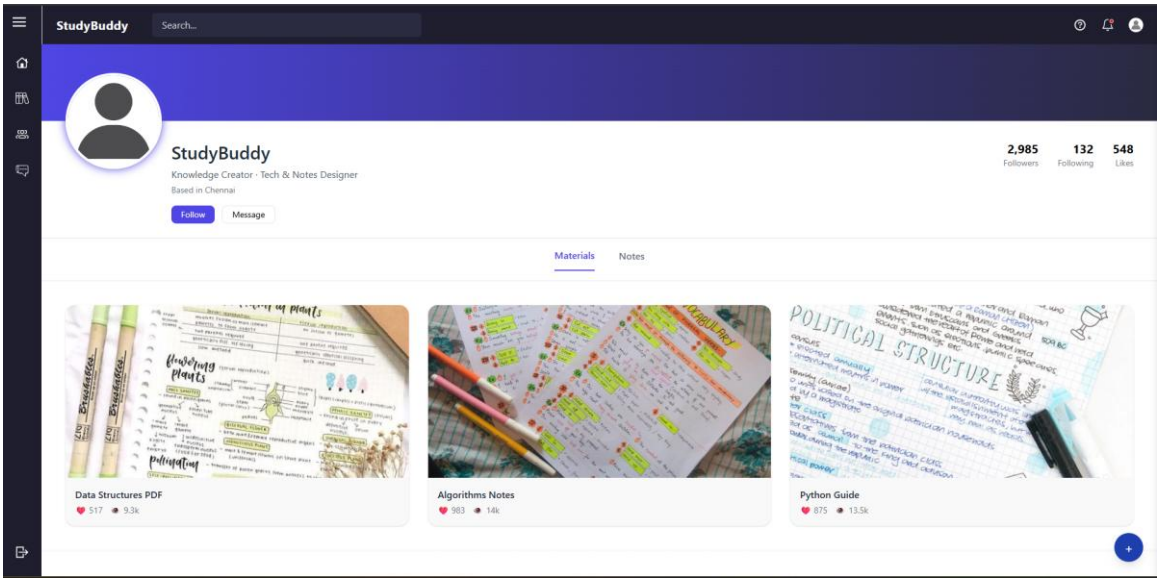

Figure 4.3: Study Buddy notes repository and mentoring session dashboard

4.1.6. User Feedback and System Usability

Comprehensive feedback was collected from students, senior mentors, and faculty members to evaluate the system's usability, performance, and effectiveness in meeting academic and collaborative needs.

Result: Approximately 92% of participants rated the platform as intuitive and user-friendly, highlighting the ease of accessing AI queries, notes repository, discussion threads, and mentoring sessions. Navigation was smooth across desktops and mobile devices.

Finding: High usability scores indicate that the platform effectively reduces fragmented access to academic resources and facilitates peer collaboration. Students appreciated the seamless integration of AI assistance, notes management, discussion forums, and mentoring sessions in a single platform.

4.2. SIGNIFICANCE, STRENGTHS, AND LIMITATIONS

4.2.1. Significance

The Study Buddy platform addresses the critical challenge of dispersed academic resources and limited student interaction. By providing a secure, integrated, and interactive environment, the system enhances collaborative learning, promotes peer mentorship, and ensures efficient dissemination of knowledge. The platform enables students to engage more actively in academic discussions, access study materials conveniently, and participate in mentoring sessions, thereby improving overall academic performance and engagement.

4.2.2. Strengths

Collaborative Knowledge Sharing: Notes repository and discussion forum foster peer-to-peer learning and resource sharing.

Mentorship Facilitation: Seniors can guide juniors through structured mentoring sessions, improving academic support.

Centralized Data Management: Flask backend with MongoDB ensures secure, reliable, and fast data retrieval.

Accessibility: Responsive React frontend allows students to access features from desktop or mobile devices efficiently.

4.2.3. Limitations

Scalability Concerns: The system may require optimization to handle many concurrent users efficiently.

Mobile-Specific Experience: While responsive, a dedicated mobile application could provide enhanced convenience and usability.

User Training Requirements: Some students may require initial guidance to fully utilize advanced functionalities such as session scheduling, note rating, and AI-assisted queries.

4.3. COST-BENEFIT ANALYSIS

4.3.1. Development Costs

The Study Buddy platform leverages open-source frameworks and tools, resulting in minimal financial investment while maintaining high system performance.

Component	Cost
Flask Backend & MongoDB	$0
React Frontend Development	$0
Development Time	230 hours

Table: 4.1 cost benefit analysis

Benefits:

Efficiency: AI query assistance, automated notifications, and session scheduling reduce manual effort and reliance on peer networks.

Accessibility: Centralized access to notes, forums, and mentoring sessions improves convenience and academic engagement.

Collaboration: Discussion forums, note sharing, and mentorship enhance peer learning and teamwork.

Security: Role-based authentication and JWT integration protect sensitive academic and personal data.

4.4. SUMMARY

This chapter presented the results, significance, strengths, limitations, and cost-benefit analysis of the Study Buddy platform. The findings demonstrate that features such as secure registration, AI-assisted query resolution, collaborative notes repository, discussion forums, and structured mentoring sessions effectively meet the project objectives.

Although minor limitations exist in scalability and mobile-specific usability, the Study Buddy system is cost-effective, intuitive, and highly beneficial for students' academic collaboration, peer learning, and engagement. Future improvements, such as a dedicated mobile application, AI-driven personalized content recommendations, and advanced analytics for tracking student participation, could further enhance the platform's effectiveness, accessibility, and overall impact on academic performance.

CHAPTER 5

CONCLUSIONS & SUGGESTIONS FOR FUTURE WORK

The design, development, and implementation of the Study Buddy platform demonstrate its potential to significantly enhance student interaction, collaborative learning, and academic support within the college environment. The system effectively addresses challenges such as fragmented access to study resources, delayed doubt clarification, scattered notes, and limited peer mentorship opportunities.

Findings from the testing and user evaluation phase revealed a high satisfaction rate of approximately 92–93%, with students, senior mentors, and faculty members appreciating the intuitive interface, AI-powered query responses, structured notes repository, interactive discussion forums, and automated mentoring session notifications. The platform also demonstrated fast data retrieval and reliable performance through optimized Flask backend endpoints and MongoDB indexing, confirming its readiness for deployment in a live academic setting.

5.1. CONCLUSION

In conclusion, the proposed Study Buddy system successfully addresses several persistent challenges in student collaboration, academic resource management, and peer mentorship by integrating multiple intelligent and interactive features:

Collaborative Notes Repository: Allows students and seniors to upload, categorize, rate, and access study materials efficiently.

Discussion Forum: Enables structured discussions, peer replies, mentorship interactions, and topic-based categorization for improved collaborative learning.

Mentoring Session Scheduling and Notifications: Facilitates senior-junior guidance sessions with automated registration, reminders, and attendance tracking.

Secure Authentication via JWT and Optional Google OAuth: Ensures only authorized users can access sensitive academic and mentorship data, maintaining high levels of security and privacy.

The responsive React frontend combined with a Flask backend and MongoDB storage provides robust, scalable, and maintainable architecture capable of handling a growing student user base. Feedback collected during the testing phase confirmed that the platform improves learning productivity, reduces dependency on informal peer networks for immediate academic support, and fosters structured peer-to-peer engagement. Overall, Study Buddy represents a significant advancement in the digital transformation of student learning, collaboration, and mentorship services within the college ecosystem.

5.2 COMPARATIVE ANALYSIS: STUDY BUDDY VS. EXISTING SYSTEMS

Study Buddy distinguishes itself by providing a centralized, intelligent, and collaborative academic platform. Unlike traditional systems that focus on isolated functionalities, Study Buddy integrates notes sharing, real-time doubt resolution, peer mentoring, and analytics into a single, coherent environment.

Integration and Accessibility:

While LMS and ERP portals handle specific tasks, Study Buddy unifies study material access, doubt-solving, and peer collaboration under one platform. Students can browse categorized notes, post queries, chat with seniors, and schedule guided mentoring sessions, all through an intuitive and responsive interface.

Real-Time Interaction:

Unlike rule-based or standalone chatbots, Study Buddy leverages Socket.io for instant messaging and audio/video sessions, allowing real-time, context-aware doubt resolution. Students can interact directly with seniors or mentors, receive immediate feedback, and participate in collaborative learning sessions.

Structured Peer Learning Environment:

Study Buddy organizes discussions and resource sharing by department, semester, and subject, ensuring that interactions are focused, moderated, and academically relevant. Threaded discussions, rating systems, and review mechanisms help maintain quality and promote trust among participants.

Mentorship and Engagement Tracking:

The platform provides dashboards for mentors and administrators to monitor participation, material usage, and active discussion threads. This allows for data-driven mentorship and ensures that active contributors are recognized while students needing assistance receive timely support.

User Experience and Modern UI/UX:

Built with React (Vite) and styled with Tailwind CSS, Study Buddy offers a dynamic, visually appealing interface optimized for both desktop and mobile devices. Features like category filters, search functionality, and real-time notifications enhance usability and engagement.

Scalability and Cost-Effectiveness:

Unlike commercial solutions, Study Buddy is developed entirely with open-source technologies (React, Node.js, Express, MySQL, Tailwind CSS), ensuring affordability, flexibility, and scalability. It can support a growing

number of users while remaining responsive and stable, making it suitable for modern digital campuses.

5.3. SUGGESTIONS FOR FUTURE WORK

Several enhancements and extensions can be pursued to further improve the functionality, scalability, and impact of the Study Buddy platform:

Dedicated Mobile Application:

Developing native Android and iOS applications would increase accessibility and convenience, allowing students and mentors to access AI queries, notes, discussion forums, and mentoring sessions seamlessly from mobile devices.

Microservices Architecture:

Refactoring the backend into microservices could improve scalability and maintainability, enabling independent deployment of modules such as AI query assistant, discussion forum, notes repository, and mentoring scheduler. This approach would allow the platform to support a growing number of users without performance degradation.

Advanced Analytics and Reporting:

Implementing dashboards with analytics on forum activity, notes downloads, AI query usage, and mentoring session participation can provide actionable insights to administrators and mentors. Such analytics could support data-driven decision-making, content optimization, and improved student engagement strategies.

Enhanced Security and Compliance:

Future work could include advanced encryption methods for sensitive student data, anomaly detection tools for suspicious activity, and adherence to modern data protection and privacy standards to ensure trust and regulatory compliance.

Community Features and Gamification:

Introducing gamified elements such as points, badges, leaderboards, and achievement milestones could incentivize participation in discussion forums, note sharing, and mentoring sessions, thereby increasing engagement and collaborative learning.

By implementing these enhancements, Study Buddy can evolve into a more comprehensive, intelligent, and student-centric learning ecosystem. These improvements would further enhance academic collaboration, mentorship effectiveness, knowledge accessibility, and overall digital engagement, positioning the platform as a vital tool for fostering an enriched and interactive educational experience within the college environment.

WORK CONTRIBUTION

Batch Member 1 – MEROSAN P (7376231SE129):

Backend Development & Database Management: Designed and implemented the backend architecture using Flask and MongoDB, ensuring secure and efficient handling of users, notes, discussion threads, and mentoring sessions. Developed RESTful APIs for authentication, AI query assistance, notes repository, discussion forums, and session scheduling.

- Security & Authentication: Implemented JWT-based authentication and optional OAuth integration, with data validation and encryption to safeguard sensitive academic information.
- Testing & Performance: Conducted extensive API testing with Postman/Thunder client, debugged performance bottlenecks, and optimized endpoints for fast, reliable, and scalable backend operation.

Batch Member 2 – SUDARSANA M (7376231SE152):

Frontend Development: Developed the complete React frontend with Tailwind CSS, ensuring a responsive, intuitive, and user-friendly interface across desktops and mobiles.

- Frontend-Backend Integration: Connected React components with Flask APIs for real-time data on AI queries, notes, discussions, and mentoring sessions, ensuring seamless communication.
- UI/UX & Responsiveness: Designed visually appealing layouts, forms, and dashboards for enhanced usability and student engagement.
